

STOOLING RYE

LEBA

LATE HEADING

LEBA is a later flowering Stooling. LEBA is fairly drought and cold tolerant and can handle cold, but tends to go into Stooling mode when it gets too cold. Leba has good regenerative properties after a grazing.

LEBA needs a cold spell to vernalize and can therefore be planted fairly early in autumn (February / March)

LEBA has good dry matter production.

Recommended sowing rate 35-50kg / ha dry land, planted in rows. 75 – 100kg/ha broadcast or irrigated.

- Later flowering stooling
- Fairly drought and cold tolerant
- Planted early in Autumn (Feb/Mar)
- Good dry matter production
